DATE MAILED: 11/19/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

	Application No.	Applicant(s)
Office Action Summary	09/714,246	DI BENEDETTO ET AL.
	Examiner	Art Unit
	Ian N Moore	2661

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM
THE MAILING DATE OF THIS COMMUNICATION.
- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *amendment filed on 07 July 2004*.

2a)☒ This action is **FINAL**.   2b)☐ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *2-4, 6-13 and 15-29* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☒ Claim(s) *2-4 and 6-11* is/are allowed.

6)☒ Claim(s) *12,13 and 15-29* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☒ The drawing(s) filed on *07 July 2004* is/are: a)☒ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All   b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08) Paper No(s)/Mail Date _____.
4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date. _____ .
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: _____.

DETAILED ACTION

Response to Amendment

1.   Claim objections, on claims 1 withdrawn since they are being amended accordingly.

2.   Claims 1, 5, 14 are canceled.

3.   Claims 2,6,9, 10 and 12 are amended.

4.   New claims 15-29 are added.

5.   Claims 12,13, 15-29 are rejected by the new ground(s) of rejection necessitated by the

amendment.

Claim Objections

6.   Claim 6 is objected to because of the following informalities and appropriate correction is

required. *Note that this objection is reiteration to the previous claim objection recited in last*

office action section 1.

>   **Claim 6** recites, "…a crash or failure…" in line 4. For consistency, it is suggested to
>
>   replace with "**the** crash or failure".

Claim Rejections - 35 USC § 112

7.   The following is a quotation of the second paragraph of 35 U.S.C. 112:

> The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the
> subject matter which the applicant regards as his invention.

8.   Claim 15, 18, 21,24,27 are rejected under 35 U.S.C. 112, second paragraph, as being

indefinite for failing to particularly point out and distinctly claim the subject matter which

applicant regards as the invention.

Claim 15 recites the limitation **"the** event" in line 8. There is insufficient antecedent basis for this limitation in the claim.

Claim 18 recites the limitation **"the** event" in line 7. There is insufficient antecedent basis for this limitation in the claim. Claim 18 also recites "**one** line card" in line 4. It is unclear whether "one line card" recites in line 4 is different from "one line card" recites in line 2.

Claim 21 recites the limitation **"the** event" in line 9. There is insufficient antecedent basis for this limitation in the claim.

Claim 24 recites the limitation **"the** event" in line 9. There is insufficient antecedent basis for this limitation in the claim.

Claim 27 recites the limitation **"the** event" in line 10. There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 102

9.   The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

10.   Claims 16,17,19,20,22,23,25,26, 28 and 29 are rejected under 35 U.S.C. 102(e) as being anticipated by Ronstrom (U.S.6, 438,707).

Regarding Claim 16, Ronstrom discloses method for operating a network device (see FIG. 1, Fault tolerant computer system), comprising:

operating an active supervisor (see FIG. 1, Primary System PS 100), the active supervisor creating (see FIG. 1, Event Generator 103) an instance of an event (see col. 7, lines 58-67; see col. 8, lines 51-60; event message) in response to a change in operating state from a requesting application (see FIG. 1, applications runs devices 141-144, Fault detection means FD 120, Backup system BS 110; see col. 6, lines 39-67); see FIG. 3, step 301-302; see col. 12, lines 10-55; see FIG. 6, step 601; see col. 16, lines 55-67);

providing the event instance to the requesting application and any listening applications that have registered for the event for processing (see col. 7, lines 24-40);

passing the event instance to a standby supervisor (see FIG. 1 Backup system BS 110; see FIG. 6, step 602; see col. 16, lines 55-67);

receiving notifications from the requesting and listening applications that they have completed their processing of the event instance (see col. 7, lines 24-56; see FIG. 4, step 401-407; see col. 14, lines 30 to col. 15, lines 20);

passing the notifications to the standby supervisor (see FIG. 6, step 602,609, 612; see FIG. 3, step 306; see col. 16, lines 35 to col. 17, lines 60); and

in response to receiving notifications from the requesting and all listening applications, closing the event instance at the active and standby supervisors (see FIG. 3, step 309, 312; see col. 13, lines 44 to col. 14, lines 7; see FIG. 6, step 616-617; see col. 18, lines 6-24; note that PS 100 and BS 110 close current processing event only upon completion before processing next event).

Regarding Claim 17, Ronstrom discloses in response to a failure of the active

supervisor (see FIG. 3, step 307,308,309), determining whether one or more event instances

passed to the standby supervisor remain open (see FIG. 3, step 310, 311; see col. 13, lines 36

to col. 14, lines 10; note that processing of events will not match if they are incomplete due

to failure/fault);

identifying the requesting and listening applications, if any, that have not completed

their processing of an open event instance (see FIG. 3, step 310; see FIG. 5, steps 504-509;

see col. 15, lines 60 to col. 16, lines 39; see FIG. 6, step 601-605; see col. 16, lines 35-65;

note that event sequences, for applications that are not completed, are identified by

comparing the events between PS and BS) and

calling a recovery function (see FIG. 3, start recovery procedure 313 and see FIG. 5,

start recovery procedure 510) defined by the respective application to handle the open event

instance (see col. 14, lines 10-30; see col. 16, lines 19-36; note that any existing/opening

events are handled by the backup system BS).

Regarding Claim 19, Ronstrom discloses a network device (see FIG. 1, Fault

tolerant computer system), comprising;

an active supervisor (see FIG. 1, Primary System PS 100) to run applications, the

active supervisor to create (see FIG. 1, Event Generator 103) an instance of an event (see col.

7, lines 58-67; see col. 8, lines 51-60; event message) in response to a change in operating

state from a requesting application (see FIG. 1, applications runs devices 141-144, Fault

detection means FD 120, Backup system BS 110; see col. 6, lines 39-67), to provide the

event instance to the requesting application and any listening applications that have

registered for the event for processing (see col. 7, lines 24-40), and to receive notifications

from the requesting and listening applications that they have completed their processing of

the event instance (see col. 7, lines 24-56; see FIG. 4, step 401-407; see col. 14, lines 30 to

col. 15, lines 20); and

a standby supervisor to receive the event instance and the notifications from the

active supervisor (see FIG. 1 Backup system BS 110; see FIG. 6, step 602; see col. 16, lines

55-67; see FIG. 6, step 602,609, 612; see FIG. 3, step 306; see col. 16, lines 3 to col. 17, lines

60), where in response to receiving notifications from the requesting and all listening

applications, the active and standby supervisors are to close the event instance (see FIG. 3,

step 309, 312; see col. 13, lines 44 to col. 14, lines 7; see FIG. 6, step 616-617; see col. 18,

lines 6-24; note that PS 100 and BS 110 close current processing event only upon completion

before processing next event).

Regarding Claim 20, in response to a failure of the active supervisor (see FIG. 3,

step 307,308,309), the standby supervisor is further to determine whether one or more event

instances passed to the standby supervisor remain open (see FIG. 3, step 310, 311; see col.

13, lines 36 to col. 14, lines 10; note that processing of events will not match if they are

incomplete due to failure/fault), to identify the requesting and listening applications, if any,

that have not completed their processing of an open event instance (see FIG. 3, step 310; see

FIG. 5, steps 504-509; see col. 15, lines 60 to col. 16, lines 39; see FIG. 6, step 601-605; see

col. 16, lines 35-65; note that event sequences, for applications that are not completed, are

identified by comparing the events between PS and BS), and to call a recovery function (see

FIG. 3, start recovery procedure 313 and see FIG. 5, start recovery procedure 510) defined by

the respective application to handle the open event instance (see col. 14, lines 10-30; see col. 16, lines 19-36; note that any existing/opening events are handled by the backup system BS).

Regarding Claim 22, 25, 28, claims 22, 25 and 28 are the claims that involve a network device, a instruction for execution of a processor on computer readable medium, electromagnetic signals carrying instructions for execution on a processor which that substantially all the limitations of the respective method claim 16 and device claim 19. Therefore, they are subjected to the same rejections.

Regarding Claim 23, 26, 29, claims 23, 26 and 29 are the claims that involve a network device, a instruction for execution of a processor on computer readable medium, electromagnetic signals carrying instructions for execution on a processor which that substantially all the limitations of the respective method claim 17 and device claim 20. Therefore, they are subjected to the same rejections.

Claim Rejections - 35 USC § 103

11.   The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

12.   Claim 12 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kicklighter (U.S. 6,005,841) in view of Freedman (U.S. 4,342,083).

Regarding Claim 12, Kicklighter discloses an intermediate network device for use in a computer network (see FIG. 1, a network switch 2), the network device comprising:

a first supervisor card (see FIG. 1, PRI 38(A)) in communicating relationship (see

FIG. 1, Switching Buses 30) with the one or more line cards (see FIG. 1, Line Cards IO 20);

a second supervisor card (see FIG. 1, PRI 38(S) in communication relations (see FIG.

1, Switching Buses 30) with the first supervisor card;

an application loaded onto the first and second supervisor cards (see col.5, lines 65 to

col.6, lines 18), the application configured to define and manipulate a plurality of state

variables (see col. 4, lines 51-55; the configuration/switching/synchronizing/

management/supervisory application defines/performs/runs/executes/manipulates the

plurality of events/tasks/states occurrences (i.e. state variables)); and

at least one line card (see FIG. 1, Line Cards IO 20) defining a plurality of ports for

forwarding messages (see FIG. 1, Line Cards IO receives and transmits the frames) across

the computer network (see col. 2, lines 5-7), the at least one line card in communicating

relationship with the first and second supervisor cards and configured to receive and state

information from the application (see FIG. 1, Line cards communicate with PRI 38(A) and

PRI (B) via buses and via Nodal Switch or CPU/matrix 44);

a high availability entity (see FIG. 2, PRI 38 and 30a-b) disposed on the first and

second supervisor cards, the high availability entities comprising:

an event mechanism (see FIG. 2, components 30a, 30b, 60,62,64,66,68,70,72,74,76,

78,80,84,86 and 88) for notifying a selected one of the first or second supervisor cards of

changes to the application's state variables (see col. 2, lines 24-34); and

a database mechanism (see FIG. 2, ROM 90, RAM 92, shared RAM 82) for storing

the state variables at the first and second supervisor cards (see col. 2, lines 34-39).

the state variables stored at the first and second supervisor cards are consistent with

the port state information maintained at the at least one line card (see FIG. 2; PRI 38 card

commands/instructs the line card IO (via Nodal Switch or CPU/matrix 44) to update/change

the switching/ management/supervisory events/tasks/conditions/states; see col. 4, lines 51-67.

Each line card is the IO (Input and output) module, and it must have a memory/caching

mechanism to maintain/store the command/instruction of the state information of each port.

Thus, it is clear that plurality of events/tasks/states occurrences (i.e. state variables) in both

PRI 38 cards are consistent with each line card's call processing or framing states/tasks

information (i.e. port states).)

Kicklighter does not explicitly disclose a sequence mechanism resetting the line

card/system in the event that the state variable and the port state information differ after a

failure of one of the first or second cards/systems. However, it is well known in the art that

when a command/instruction is generated by the processor/controller, it must have a

sequence number, timer, time-stamp, or clock cycle that identifies a particular

instruction/command along with the contents of the instruction/command so that the recipient

can identify, store, and performs tasks synchronously. Freedman discloses a sequence

mechanism for ensuring the state variables (see FIG. 4, sampling number; see col. 13, lines

36-55) stored (see FIG. 3, Memory 16; see col. 7, lines 60-65) at the first and second systems

(see FIG. 2, Application computers 100n) are consistent with state information (see FIG. 4,

tasks information) maintained at the at the line system (see FIG. 2, Application computer

100a-b; see col. 15, lines 60), and resetting the at least one line card/system (see FIG. 5,

Synchronizer 226; see col. 16, lines 34-52) in the event that the state variable and the state

information differ (see col. 15, lines 52-60) after a failure of one of the first or second cards/system (see col. 16, lines 11-21).

Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to provide synchronization mechanism between different systems after failure of one system, as taught by Freedman in the system of Kicklighter, so that it would permit each computer system to communicate with every other computer in the system to coordinate the execution tasks; see Freedman col. 2, line 10-45, and it would ensure more reliable increase the recipient capability to identify, store, and performs commanded/instructed tasks synchronously.

Regarding Claim 13, Kicklighter discloses the first supervisor card is designated as an active supervisor card (see FIG. 1, PRI 38(A) as active) and the second supervisor card is designated as a standby supervisor card (see FIG. 1, PRI 38(S) as standby) for the network device; see col. 6, lines 35-36;

the application is allowed to run on the active supervisor card but not on the standby supervisor card (see col. 2, lines 13-20; note the PRI 38(S) is placed in a standby/listening mode, thus, it does not execute any task/applications);

in response to a crash or failure of the active supervisor card, the application carries on its execution from the standby supervisor card utilizing at least some of the state variables stored at the database mechanism of the standby supervisor card (see col. 2, lines 39-44; note that when PRI 38(A) fails, the PRI 38(S) continues the servicing/performing/executing the events/tasks/applications just prior to failure according to the stored/hold events/tasks/applications.)

13.   Claim 15,18,21,24 and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Horst (5,838,894) in view of Ronstrom (U.S. 6,438,707).

       Regarding Claim 15, Horst discloses method for operating a network device (see

FIG. 1A, data processing system 10), comprising:

       operating an active supervisor (see FIG. 1A, CPU 12A), the active supervisor

receiving state information (see FIG. 23, interface unit 24a receives information symbols and

its T_ClK; see col. 74 , lines 55 to co. 75, lines 44) from at least one line card (see FIG. 1,

Router 14A or B or system 10);

       generating a sequence (see FIG. 31B, SYNC CLK; see col. 76, lines 40-46) by the

active supervisor in response to receipt of state information (see col. 75, lines 60 to col. 76,

lines 16, 41-46; also see FIG. 33A, step 1050);

       returning the sequence to the at least one line card (see FIG. 31A, step 956, sending

SYNC CLK; see col. 77, lines 25-35; also see FIG. 33A, step 1052-1053);

       storing the state information and sequence to a standby supervisor (see FIG. 1, CPU

10B; see FIG. 25, a signal line 667 from CPU 10A to Clock generator 654B for SYNC CLK;

see col. 66, lines 44 to col.67; see col. 67, lines 12-45; see FIG. 33B, step 1080,1082,1084)

       in the event of a failure of the active supervisor, switching control to the standby

supervisor (see FIG. 32, step 1012; see col. 78, lines 45-60; see col. 80, lines 36-64);

       comparing, by the standby supervisor, a stored sequence with a reported sequence,

the reported sequence number reported by a line card (see col. 77, lines 21 to col. 78, lines

40; note that CPU clock SYN_CLK and router clock must be compared before resting the

clock); and

resetting the line card in the event that the reported sequence number is different than

the stored sequence number (see FIG. 31A, step 960, router clock reset; see col. 77, lines 38-

60; see col. 78, lines 64 to col. 79, lines 15).

Horst does not explicitly disclose sequence number. It is well known in the art the

when a working CPU fails, the standby process must take over the processing which involves

resynchronization the processing sequence numbers and events between all components

within the system. Ronstrom teaches operating an active supervisor (see FIG. 1, Primary

System PS 100), the active supervisor receiving state information (see FIG. 1,

communication means 130; see col. 7, lines 1-40; see FIG. 6, step 601, event message; see

col. 16, lines 55-65); generating a sequence number (see FIG. 6, process sequence number A,

B(1),C,B(2), or D) by the active supervisor in response to receipt of the state information (see

FIG. 1, Event Generator EG 103; see col. 7, lines 56 to col. 8, lines 6; see col. 5, lines 50-60);

storing the state information and sequence number to a standby supervisor (see FIG. Primary

Memory PM 102; see col. 7, lines 6-19); comparing, by the standby supervisor, a stored

sequence number with a reported sequence number (see FIG. 5, step 507, 509; see col. 16,

lines 5-20); resetting in the event that the reported sequence number is different than the

stored sequence number (see FIG. 5, step 510, recovery process; see col. 16, lines 18-25; see

FIG. 7, 701-711; see col. 18, lines 25 to col. 19, lines 10). Therefore, it would have been

obvious to one having ordinary skill in the art at the time the invention was made to provide

sequencing the event utilizing a sequence number and synchronizing by utilizing the

sequence number after a failure as part of the recovering process, as taught by Ronstrom in

the system of Horst, so that it would provide a fault tolerant system requiring a low

communication load between systems while allowing high level of synchronization; see

Ronstrom col. 1, line 44-55.

Regarding Claim 18, Horst discloses a network device (see FIG. 1A, data processing

system 10), comprising:

at least one line card (see FIG. 1, Router 14A or B or system 10);

an active supervisor (see FIG. 1A, CPU 12A), the active supervisor to receive state

information from at least one line card (see FIG. 23, interface unit 24a receives information

symbols and its T_ClK; see col. 74 , lines 55 to co. 75, lines 44), generate a sequence (see

FIG. 31B, SYNC CLK; see col. 76, lines 40-46) in response to receipt of the state

information (see col. 75, lines 60 to col. 76, lines 16, 41-46; also see FIG. 33A, step 1050),

and return the sequence number to the at least one line card (see FIG. 31A, step 956, sending

SYNC CLK; see col. 77, lines 25-35; also see FIG. 33A, step 1052-1053); a standby

supervisor, the standby supervisor to store the state information and sequence (see FIG. 1,

CPU 10B; see FIG. 25, a signal line 667 from CPU 10A to Clock generator 654B for SYNC

CLK; see col. 66, lines 44 to col.67; see col. 67, lines 12-45; see FIG. 33B, step

1080,1082,1084), where in the event of a failure of the active supervisor and control is

switched to the standby supervisor (see FIG. 32, step 1012; see col. 78, lines 45-60; see col.

80, lines 36-64), the standby supervisor is to compare a stored sequence with a reported

sequence, the reported sequence reported by a line card (see col. 77, lines 21 to col. 78, lines

40; note that CPU clock SYN_CLK and router clock must be compared before resting the

clock), and to reset the line card in the event that the reported sequence number is different

than the stored sequence (see FIG. 31A, step 960, router clock reset; see col. 77, lines 38-60;

see col. 78, lines 64 to col. 79, lines 15).

Horst does not explicitly disclose sequence number. It is well known in the art the

when a working CPU fails, the standby process must take over the processing which involves

resynchronization the processing sequence numbers and events between all components

within the system. Ronstrom teaches operating an active supervisor (see FIG. 1, Primary

System PS 100), the active supervisor receiving state information (see FIG. 1,

communication means 130; see col. 7, lines 1-40; see FIG. 6, step 601, event message; see

col. 16, lines 55-65); generating a sequence number (see FIG. 6, process sequence number A,

B(1),C,B(2), or D) by the active supervisor in response to receipt of the state information (see

FIG. 1, Event Generator EG 103; see col. 7, lines 56 to col. 8, lines 6; see col. 5, lines 50-60);

storing the state information and sequence number to a standby supervisor (see FIG. Primary

Memory PM 102; see col. 7, lines 6-19); comparing, by the standby supervisor, a stored

sequence number with a reported sequence number (see FIG. 5, step 507, 509; see col. 16,

lines 5-20); resetting in the event that the reported sequence number is different than the

stored sequence number (see FIG. 5, step 510, recovery process; see col. 16, lines 18-25; see

FIG. 7, 701-711; see col. 18, lines 25 to col. 19, lines 10). Therefore, it would have been

obvious to one having ordinary skill in the art at the time the invention was made to provide

sequencing the event utilizing a sequence number and synchronizing by utilizing the

sequence number after a failure as part of the recovering process, as taught by Ronstrom in

the system of Horst, so that it would provide a fault tolerant system requiring a low

communication load between systems while allowing high level of synchronization; see

Ronstrom col. 1, line 44-55.

Regarding Claim 21,24,27, claims 21, 24 and 27 are the claims that involve a

network device, a instruction for execution of a processor on computer readable medium,

electromagnetic signals carrying instructions for execution on a processor which that

substantially all the limitations of the respective method claim 15 and device claim 18.

Therefore, they are subjected to the same rejections.

Allowable Subject Matter

14.   Claim 2,3,4,6-9, and 10-11 are allowed.

Response to Arguments

15.   Applicant's arguments with respect to claims 12,13, and 15-29 have been considered but

are moot in view of the new ground(s) of rejection.

Conclusion

16.   Applicant's amendment necessitated the new ground(s) of rejection presented in this

Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a).

Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE

MONTHS from the mailing date of this action. In the event a first reply is filed within TWO

MONTHS of the mailing date of this final action and the advisory action is not mailed until after

the end of the THREE-MONTH shortened statutory period, then the shortened statutory period

will expire on the date the advisory action is mailed, and any extension fee pursuant to 37

CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

however, will the statutory period for reply expire later than SIX MONTHS from the date of this

final action.

17.   Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Ian N Moore whose telephone number is 571-272-3085. The

examiner can normally be reached on M-F: 9-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Ken Vanderpuye can be reached on 571-272-3078. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
